MR Brain

Event Time: Wed, 04 Aug 10 2130

Status: complete

Fri, 06 Aug 10 0658 Documented by

Accession# : 303501412  
 Read By : Timo Krings, MD  
 Date Dictated: 05Aug2010  
 Exam Report :

REPORT (VERIFIED 2010/08/06)

CLINICAL HISTORY: Follow-up of left parietal oligo.

TECHNIQUE: Multisequence, multiplanar enhanced MR of the brain.

COMPARISON: Previous MR of August 12th, 2009 and multiple prior.

FINDINGS:

In comparison to the previous exam, there is no interval change. There is evidence of previous high left parietal occipital craniotomy with partly gliotic and partly cystic appearing encephalomalacia over the left parietal convexity associated with regional volume loss. There is evidence for hemosiderin depositions noted within the parenchyma adjacent to the porencephalic enlargement of the atrium and the left lateral ventricle. There is no evidence of enhancing tumor. There is no evidence for enlargement of the nonenhancing tumor. Periventricular chronic ischemic white matter changes are noted, these are unchanged compared to previous.

IMPRESSION:

Stable appearance in comparison to multiple prior exams. No evidence for residual or recurrent tumor.
